- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

Just as in Euclidean geometry, we can consider the set of points whose homogeneous coordinates satisfy a “quadratic.”

In this case, we use a *quadratic form* and it is not hard to show that there is precisely one non-degenerate form. Using coordinates (x, y, z) , the canonical representation is

$$y^2 = xz.$$

quadratic forms

❖ Introduction to conics

- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

So, a non-degenerate conic consists of the points whose homogeneous coordinates are

$$(1, x, x^2), \text{ for some } x \in GF(q)$$

or

$$(0, 0, 1).$$

quadratic forms

- ❖ Introduction to conics

- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

So, a non-degenerate conic consists of the points whose homogeneous coordinates are

$$(1, x, x^2), \text{ for some } x \in GF(q)$$

or

$$(0, 0, 1).$$

This gives a total of $q + 1$ points.

quadratic forms

❖ Introduction to conics

- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

So, a non-degenerate conic consists of the points whose homogeneous coordinates are

$$(1, x, x^2), \text{ for some } x \in GF(q)$$

or

$$(0, 0, 1).$$

This gives a total of $q + 1$ points.

Every non-degenerate conic is an *arc*, a set of points, no three collinear. A famous theorem due to Segre says that when q is odd, every set of $q + 1$ points, no three collinear, is actually a conic.

synthetic properties

❖ Introduction to conics

- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

Since conics form arcs, no line can meet a conic in more than 2 points.

synthetic properties

❖ Introduction to conics

- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

Since conics form arcs, no line can meet a conic in more than 2 points.

We have secant lines, tangent lines, and skew lines.

❖ Anti-Blocking Sets

❖ Caps

❖ Conclusions

Define \mathcal{C}_0 as the conic whose points satisfy $x^2 - yz = 0$, and \mathcal{C}_∞ as satisfying $z^2 = 0$

Then, the conics in the pencil are defined by the linear combinations of these:

\mathcal{C}_k is defined by $x^2 - yz + kz^2 = 0$.

algebraic description

❖ Introduction to conics

❖ **Semiovals**

❖ Anti-Blocking Sets

❖ Caps

❖ Conclusions

Define \mathcal{C}_0 as the conic whose points satisfy $x^2 - yz = 0$, and \mathcal{C}_∞ as satisfying $z^2 = 0$

Then, the conics in the pencil are defined by the linear combinations of these:

\mathcal{C}_k is defined by $x^2 - yz + kz^2 = 0$.

In the arguments, Szőnyi shows that all points are “essential.” In other words, no point can be removed without destroying the blocking property. This implies that there are tangent lines at each of the points.

algebraic description

❖ Introduction to conics

❖ **Semiovals**

❖ Anti-Blocking Sets

❖ Caps

❖ Conclusions

Define \mathcal{C}_0 as the conic whose points satisfy $x^2 - yz = 0$, and \mathcal{C}_∞ as satisfying $z^2 = 0$

Then, the conics in the pencil are defined by the linear combinations of these:

\mathcal{C}_k is defined by $x^2 - yz + kz^2 = 0$.

In the arguments, Szőnyi shows that all points are “essential.” In other words, no point can be removed without destroying the blocking property. This implies that there are tangent lines at each of the points.

But, conics have *unique* tangents at each point. Hence, Szőnyi’s set is a semioval.

Our Main Result

❖ Introduction to conics

❖ **Semiovals**

❖ Anti-Blocking Sets

❖ Caps

❖ Conclusions

Theorem: Let $\mathcal{B} = \bigcup_{i=1}^k \mathcal{C}_i$ be a semioval in $PG(2, q)$ that is the union of nondegenerate conics \mathcal{C}_i . Then \mathcal{B} is isomorphic to one of the following sets:

- a conic (note that this is the only possibility when q is even), or
- a union of at most \sqrt{q} conics all lying in a common pencil, or
- a union of at most four conics, no three in a common pencil.

Our Main Result

❖ Introduction to conics

❖ **Semiovals**

❖ Anti-Blocking Sets

❖ Caps

❖ Conclusions

Theorem: Let $\mathcal{B} = \bigcup_{i=1}^k \mathcal{C}_i$ be a semioval in $PG(2, q)$ that is the union of nondegenerate conics \mathcal{C}_i . Then \mathcal{B} is isomorphic to one of the following sets:

- a conic (note that this is the only possibility when q is even), or
- a union of at most \sqrt{q} conics all lying in a common pencil, or
- a union of at most four conics, no three in a common pencil.

So the semiovals that can be written as a union of conics are completely classified.

What is a blocking set?

❖ Introduction to conics

❖ Semiovals

❖ **Anti-Blocking Sets**

❖ Caps

❖ Conclusions

A blocking set \mathcal{S} in a projective plane π is a set of points such that every line in π contains at least one point in \mathcal{S} and one point not in \mathcal{S} . Therefore \mathcal{S} intersects every line in π but \mathcal{S} contains no lines.

❖ Anti-Blocking Sets

❖ Caps

❖ Conclusions

Theorem Let \mathcal{A} be an anti-blocking set and \mathcal{L} the set of all lines that do not contain a point of \mathcal{A} . Then $|\mathcal{L}| \leq 2$.

By way of contradiction, suppose $|\mathcal{L}| \not\leq 2$ so that $|\mathcal{L}| \geq 3$. We show that points can be added to \mathcal{A} in such a way as to build a blocking set. Therefore, \mathcal{A} is in fact a subset of a blocking set and so is not an anti-blocking set. This will prove our result.

❖ Conclusions

If $P = (0, a, b)$ and $a^2 + ab + eb^2$ is a non-square, the special line is

$$\ell = \langle (0, a, b), (1, 0, 0) \rangle$$

If $P = (0, a, b)$ and $a^2 + ab + eb^2$ is a square, we have two lines:

$$\ell_+ = \langle (0, a, b), (1, 0, c) \rangle, \ell_- = \langle (0, a, b), (1, 0, -c) \rangle$$

An anti-blocking sets from a pencil

❖ Introduction to conics

❖ Semiovals

❖ **Anti-Blocking Sets**

❖ Caps

❖ Conclusions

If $P = (0, a, b)$ and $a^2 + ab + eb^2$ is a non-square, the special line is

$$\ell = \langle (0, a, b), (1, 0, 0) \rangle$$

If $P = (0, a, b)$ and $a^2 + ab + eb^2$ is a square, we have two lines:

$$\ell_+ = \langle (0, a, b), (1, 0, c) \rangle, \ell_- = \langle (0, a, b), (1, 0, -c) \rangle$$

The technique is all algebraic. We use the fact that -1 is a square, and we select λ to have certain properties (which is guaranteed by the cyclotomic numbers of order 2).

What is a cap?

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

A *cap* in a projective or affine geometry is a set of points with the property that no line meets the set in more than two points.

What is a cap?

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

A *cap* in a projective or affine geometry is a set of points with the property that no line meets the set in more than two points.

In a projective or affine plane of order q , the maximal size of a cap is bounded by $q + 1$ if q is odd, or $q + 2$ if q is even. These bounds are achieved in the Desarguesian and many other planes, though there do exist planes where the maximal cap is smaller than these bounds, for example the dual derived semifield plane of order 16.

Some bounds

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ **Caps**
- ❖ Conclusions

There exist bounds on the maximal size of a cap in higher-dimensional geometries as well, but exact values are known in only a very few small cases.

Some bounds

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

There exist bounds on the maximal size of a cap in higher-dimensional geometries as well, but exact values are known in only a very few small cases.

In $AG(4, q)$ or $PG(4, q)$, the maximal size of a cap is $\mathcal{O}(q^3)$. If $q \geq 8$ is even, the maximal size of a cap in $PG(4, q)$ is less than or equal to $q^3 - q^2 + 6q - 3$.

Some bounds

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

There exist bounds on the maximal size of a cap in higher-dimensional geometries as well, but exact values are known in only a very few small cases.

In $AG(4, q)$ or $PG(4, q)$, the maximal size of a cap is $\mathcal{O}(q^3)$. If $q \geq 8$ is even, the maximal size of a cap in $PG(4, q)$ is less than or equal to $q^3 - q^2 + 6q - 3$.

These bounds are non-constructive, and the best-known caps are significantly smaller than these bounds. In $AG(4, q)$, q even, the best known construction is due to Edel and Bierbrauer and yields a $(3q^2 + 4)$ -cap.

The Pellegrino cap

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

One celebrated result on caps is due to Pellegrino who showed that the maximal size of a cap in both $AG(4, 3)$ and $PG(4, 3)$ is 20.

The Pellegrino cap

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

One celebrated result on caps is due to Pellegrino who showed that the maximal size of a cap in both $AG(4, 3)$ and $PG(4, 3)$ is 20.

As part of an undergraduate research project, Tucker provides an interesting analysis of Pellegrino's cap in $AG(4, 3)$. Viewing $GF(9)$ as a two-dimensional vector space over $GF(3)$ with basis $\{1, \epsilon\}$, there is a natural bijection between the points of $AG(4, 3)$ and the points of $AG(2, 9)$, via $(a, b, c, d) \leftrightarrow (a + b\epsilon, c + d\epsilon)$.

The Pellegrino cap

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

One celebrated result on caps is due to Pellegrino who showed that the maximal size of a cap in both $AG(4, 3)$ and $PG(4, 3)$ is 20.

As part of an undergraduate research project, Tucker provides an interesting analysis of Pellegrino's cap in $AG(4, 3)$. Viewing $GF(9)$ as a two-dimensional vector space over $GF(3)$ with basis $\{1, \epsilon\}$, there is a natural bijection between the points of $AG(4, 3)$ and the points of $AG(2, 9)$, via $(a, b, c, d) \leftrightarrow (a + b\epsilon, c + d\epsilon)$.

Looking at the image of a Pellegrino cap in $AG(4, 3)$ under this bijection, Tucker noticed that the resulting set in $AG(2, 9)$ is the union of two conics, each conic consisting exclusively of interior points of the other conic.

Mutually good ellipses

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

Let $\pi = AG(2, q^2)$, and let $\mathcal{P} = \{C_\lambda : \lambda \in GF(q^2)\}$ be the linear pencil of conics with
 $C_\lambda = \{(x, y) \in \pi : x^2 + xy + ey^2 = \lambda\}$, where $x^2 + x + e$ is irreducible.

Mutually good ellipses

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

Let $\pi = AG(2, q^2)$, and let $\mathcal{P} = \{C_\lambda : \lambda \in GF(q^2)\}$ be the linear pencil of conics with $C_\lambda = \{(x, y) \in \pi : x^2 + xy + ey^2 = \lambda\}$, where $x^2 + x + e$ is irreducible.

Theorem: The ellipse C_λ , $\lambda \notin \{0, 1\}$, is C_1 -good if and only if for all $a, b \in GF(q^2)$ such that $\frac{2a+b}{a^2+ab+eb^2} \in GF(q) \setminus \{-1, -2\}$, $\lambda \neq (a+1)^2 + (a+1)b + eb^2$.

Mutually good ellipses

- ❖ Introduction to conics

- ❖ Conclusions

Let $\pi = AG(2, q^2)$, and let $\mathcal{P} = \{C_\lambda : \lambda \in GF(q^2)\}$ be the linear pencil of conics with $C_\lambda = \{(x, y) \in \pi : x^2 + xy + ey^2 = \lambda\}$, where $x^2 + x + e$ is irreducible.

Theorem: The ellipse C_λ , $\lambda \notin \{0, 1\}$, is C_1 -good if and only if for all $a, b \in GF(q^2)$ such that $\frac{2a+b}{a^2+ab+eb^2} \in GF(q) \setminus \{-1, -2\}$, $\lambda \neq (a+1)^2 + (a+1)b + eb^2$.

At this point, more can be said if we look at the even and odd cases separately.

q odd vs. q even

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

Theorem: Let q be an odd prime power and let λ be an element of the subfield $GF(q)$ of $GF(q^2)$ such that $\sqrt{\lambda}$ lies in $GF(q^2) \setminus GF(q)$. Then, \mathcal{C}_λ is \mathcal{C}_1 -good. Letting λ be an element of the subfield $GF(q)$ of $GF(q^2)$ such that $\sqrt{\lambda}$ lies in $GF(q^2) \setminus GF(q)$, $\mathcal{C}_1 \cup \mathcal{C}_\lambda$ is a Baer-cap.

q odd vs. q even

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ **Caps**
- ❖ Conclusions

Theorem: Let q be an odd prime power and let λ be an element of the subfield $GF(q)$ of $GF(q^2)$ such that $\sqrt{\lambda}$ lies in $GF(q^2) \setminus GF(q)$. Then, \mathcal{C}_λ is \mathcal{C}_1 -good. Letting λ be an element of the subfield $GF(q)$ of $GF(q^2)$ such that $\sqrt{\lambda}$ lies in $GF(q^2) \setminus GF(q)$, $\mathcal{C}_1 \cup \mathcal{C}_\lambda$ is a Baer-cap.

Theorem: Let q be an even prime power and suppose $\lambda^{q-1} = 1$ or $\lambda^{q+1} = 1$, with $\lambda \neq 1$. Then \mathcal{C}_λ is \mathcal{C}_1 -good. Letting $\lambda \neq 1$ satisfy either $\lambda^{q-1} = 1$ or $\lambda^{q+1} = 1$, $\mathcal{C}_1 \cup \mathcal{C}_\lambda$ is a Baer-cap. Moreover in the case where $\lambda^{q+1} = 1$, $\mathcal{C}_1 \cup \mathcal{C}_\lambda \cup \{(0, 0)\}$ is a Baer-cap.

a special case

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

Let $q \equiv -1 \pmod{4}$. Then, the set $\mathcal{C}_1 \cup \mathcal{C}_{-1}$ forms a pair of mutually good conics in $PG(2, q^2)$. Moreover, the group induced by matrices of the form

$$\phi_{a,b} = \begin{bmatrix} a + b & -b \\ eb & a \end{bmatrix}$$

with $a^2 + ab + eb^2 = \pm 1$ acts regularly on this set.

a special case

- ❖ Introduction to conics

- ❖ Conclusions

Let $q \equiv -1 \pmod{4}$. Then, the set $\mathcal{C}_1 \cup \mathcal{C}_{-1}$ forms a pair of mutually good conics in $PG(2, q^2)$. Moreover, the group induced by matrices of the form

$$\phi_{a,b} = \begin{bmatrix} a + b & -b \\ eb & a \end{bmatrix}$$

with $a^2 + ab + eb^2 = \pm 1$ acts regularly on this set.

A transitive group acting on the conics will induce a transitive action on the lifted set of points in $AG(4, q)$. Therefore, the cap admits a transitive automorphism group.

mutually good parabolas

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ **Caps**
- ❖ Conclusions

Now let $\mathcal{D}_\mu = \{(x, y) \in \pi : x = y^2 + \mu\}$ for all $\mu \in GF(q^2)$, for q an odd prime power.

mutually good parabolas

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

Now let $\mathcal{D}_\mu = \{(x, y) \in \pi : x = y^2 + \mu\}$ for all $\mu \in GF(q^2)$, for q an odd prime power.

Proposition: Let q be an odd prime power. The parabola \mathcal{D}_μ is \mathcal{D}_0 -good if and only if μ is a nonsquare in $GF(q^2)$.

mutually good parabolas

- ❖ Conclusions

Now let $\mathcal{D}_\mu = \{(x, y) \in \pi : x = y^2 + \mu\}$ for all $\mu \in GF(q^2)$, for q an odd prime power.

Proposition: Let q be an odd prime power. The parabola \mathcal{D}_μ is \mathcal{D}_0 -good if and only if μ is a nonsquare in $GF(q^2)$.

It follows that $AG(4, q)$, q odd, has a cap of size $2q^2$ lifted from two mutually good parabolas of $AG(2, q^2)$.

Larger Baer caps

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ **Caps**
- ❖ Conclusions

It is natural to ask whether or not one could possibly piece together more than 2 mutually good conics and lift them to a cap in 4-dimensional space.

Larger Baer caps

- ❖ Introduction to conics
- ❖ Semiovals
- ❖ Anti-Blocking Sets
- ❖ Caps
- ❖ Conclusions

It is natural to ask whether or not one could possibly piece together more than 2 mutually good conics and lift them to a cap in 4-dimensional space.

Theorem: Let q be an odd power of 2, so that $q \equiv 2 \pmod{3}$. Let $\lambda \neq 1$ be a cube root of unity in $GF(q^2)$. Then $\mathcal{C}_1 \cup \mathcal{C}_\lambda \cup \mathcal{C}_{\lambda^2}$ is a Baer-cap.

Theorem: Let q be an odd power of 2, so that $q \equiv 2 \pmod{3}$. Let $\lambda \neq 1$ be a cube root of unity in $GF(q^2)$. Then $\mathcal{C}_1 \cup \mathcal{C}_\lambda \cup \mathcal{C}_{\lambda^2}$ is a Baer-cap.

It is not hard to show that the point $(0, 0)$ can also be added to this Baer-cap to obtain a larger Baer-cap.

It is natural to ask whether or not one could possibly piece together more than 2 mutually good conics and lift them to a cap in 4-dimensional space.

Theorem: Let q be an odd power of 2, so that $q \equiv 2 \pmod{3}$. Let $\lambda \neq 1$ be a cube root of unity in $GF(q^2)$. Then $\mathcal{C}_1 \cup \mathcal{C}_\lambda \cup \mathcal{C}_{\lambda^2}$ is a Baer-cap.

It is not hard to show that the point $(0, 0)$ can also be added to this Baer-cap to obtain a larger Baer-cap.

The caps obtained here are almost certainly identical to the caps discovered by Edel and Bierbrauer, though their construction originated from a coding-theoretic perspective.
